## Revision History

Name	Date	Reason For Changes	Version
GUO Rui, JI Jia, Chen Mingxuan, Xie Qizhou.	2019/04/10	First version	Initial Version
GUO Rui, JI Jia, Chen Mingxuan, Xie Qizhou.	2019/05/23	Final Version	Final Version

# **1. Overview**

## **1.1 Project description**

“Brew Day!” is an application that allows home brewers to maintain an organized database of their beer recipes. The application allows users to create, store and modify recipes, and later on delete them, if the user wishes to do so. And users can write note after using a specific recipe to brew beer.

## **1.2 References**

2. Guo Rui; Chen Mingxuan; Xie QiZhou; Ji Jia, “Architecture Design\_Atanasoff\_Final”, Atanasoff Company, 2019.

## **1.3 Design purpose**

The architecture design document is to divide the system into several parts and let users work together in a more efficient way.

# **2. Overall description**

## **2.1 Class diagram**

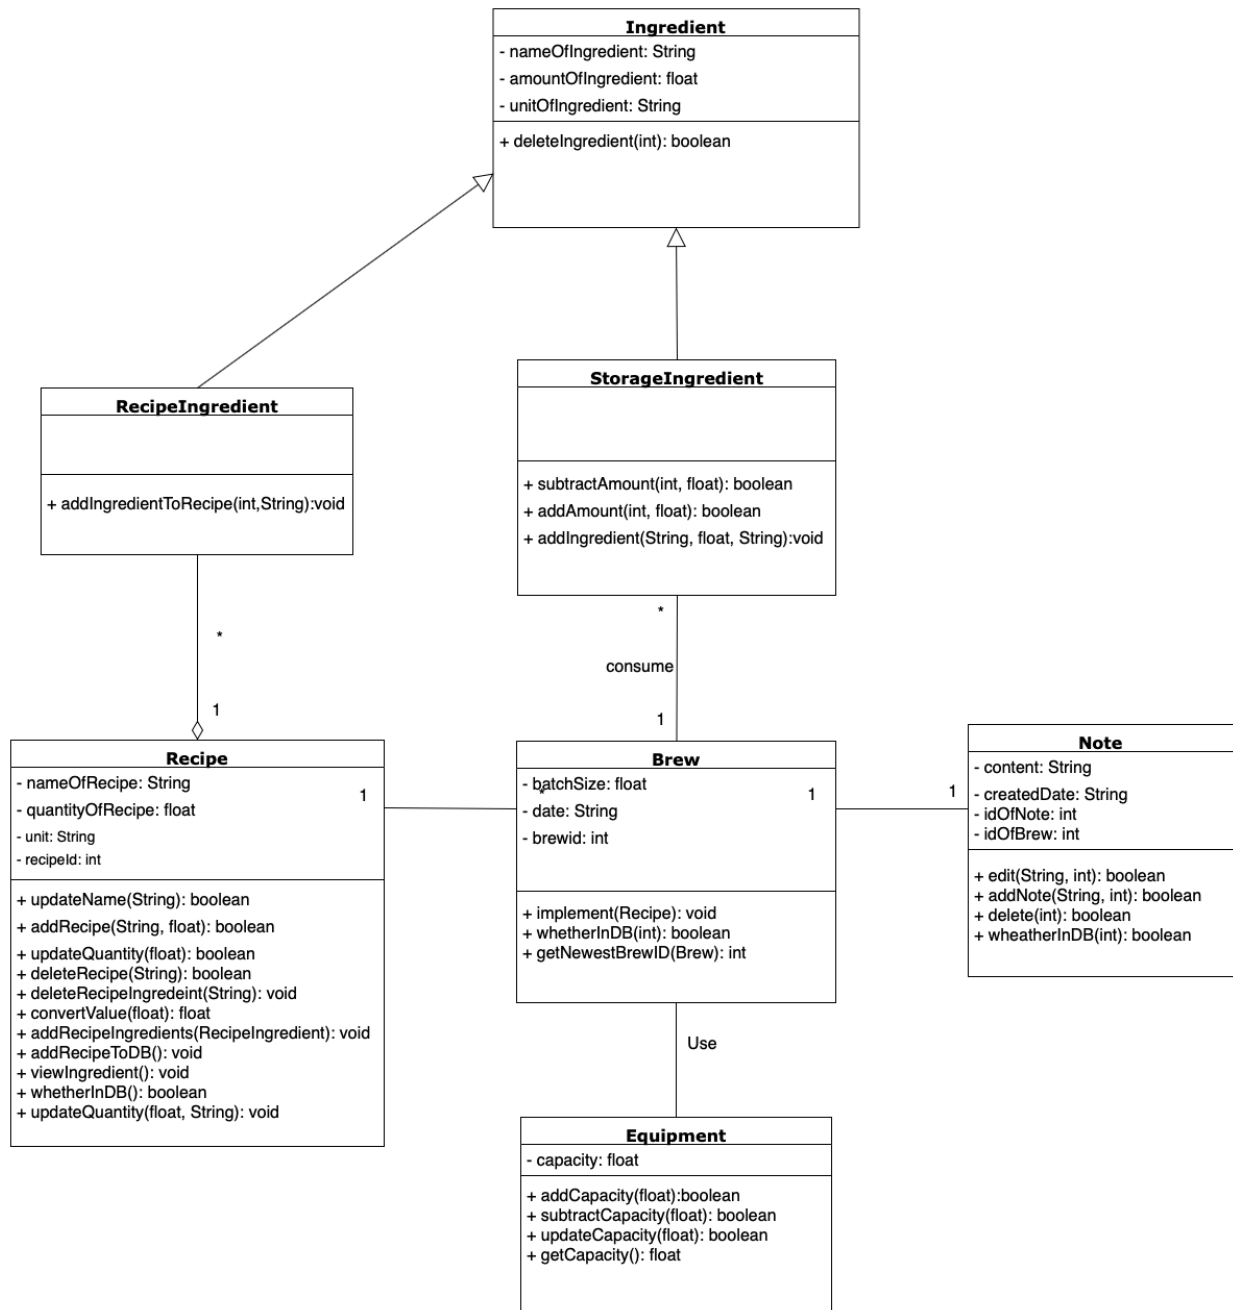

## 2.2 Refinements

In the restructuring class diagram, added a lot of detail about methods and attributes, refined the type of the attribute, the return value of the function, and the data type read.

## 3. Detailed design

### 3.1 Class diagram

## 3.2 Classes

### 3.2.1 Recipe

<b>Recipe</b>	
- nameOfRecipe: String - quantityOfRecipe: float - unit: String - recipeld: int	1
+ updateName(String): boolean + addRecipe(String, float): boolean + updateQuantity(float): boolean + deleteRecipe(String): boolean + deleteRecipeIngredint(String): void + convertValue(float): float + addRecipeIngredients(RecipeIngredient): void + addRecipeToDB(): void + viewIngredient(): void + whetherInDB(): boolean + updateQuantity(float, String): void	

#### *Explanations*

Comparing to the original class “Recipe”, the new “Recipe” class give the type of the certain attributes. For example, the nameOfRecipe is assigned to a string and the quantityOfRecipe is assigned to a float number. Also, we add a new attribute idOfRecipe into the Recipe class. This id number can help us to find the recipe in the database more easily. What’s more, the update function is now becoming updateName and updateQuantity, this can allow the user to make more changes. Lastly, the deleteRecipe function is also added, this can allow the user to delete the recipe when they want. All the attributes are hidden and all the function is public.

#### *Constraints (optional)*

N/A

### 3.2.2 Brew

<b>Brew</b>	
- batchSize: float	1
- date: String	
- brewid: int	
+ implement(Recipe): void + whetherInDB(int): boolean + getNewestBrewID(Brew): int	

#### *Explanations*

In this “Brew” class, we add one new attribute idOfBrew and set the type to be integer. All the attributes in this class are set to private. For the implement function, there are two input values: an integer and a float number. The integer is the attribute brewed and the float number is the batchSize. And this function will return a Boolean value to show that the brew process is success or not. Moreover, a new function “Recommend” is also added, this will recommend a brewing recipe to the user.

#### *Constraints (optional)*

Boolean = {NO\_ENOUGH\_INGREDIENT (0), OK (1)}

Boolean implement (int, float);

Pre-condition: the integer and the float number are not null.

Pose-condition: the return value shows that the brew process success or not.

1. If the ingredient(int) cannot support the amount of brewing number(float), that means, the ingredient is not enough for this brew action, return NO\_ENOUGH\_INGREDIENT (0).
2. Otherwise, return OK (1).

### 3.2.3 Note

<b>Note</b>
<ul style="list-style-type: none"> <li>- content: String</li> <li>- createDate: String</li> <li>- idOfNote: int</li> <li>- idOfBrew: int</li> </ul>
<ul style="list-style-type: none"> <li>+ edit(String, int): boolean</li> <li>+ addNote(String, int): boolean</li> <li>+ delete(int): boolean</li> <li>+ wheatherInDB(int): boolean</li> </ul>

#### *Explanations*

In this Note class, there are totally 4 attributes. The String type of content will storage the user input of notes. The content is assigned to string type and the createDate is assigned into String type. What's more, a new attribute idOfNote in integer type is also added. And the idOfBrew will associate with Brew record. Just like the previous ids', this can help in managing the database. Besides edit, two new functions save and delete is also added, this allow user to manage the note by themselves. All the three functions will need a integer as input and it will return a Boolean value to show that the function is successfully finished.

#### *Constraints (optional)*

N/A

### 3.2.4 Equipment

<b>Equipment</b>
- capacity: float
+ addCapacity(float):boolean + subtractCapacity(float): boolean + updateCapacity(float): boolean + getCapacity(): float

#### *Explanations*

In this Equipment class, we didn't add any new attributes to the class. The only attribute is a float number capacity. And we add three more functions updateCapacity, addCapacity and subtractCapacity. All these three functions will need a float number as an input value and it will return a Boolean value to show that the process is successfully finished or not.

#### *Constraints (optional)*

N/A

### 3.2.5 Ingredient

<b>Ingredient</b>
- nameOfIngredient: String - amountOfIngredient: float - unitOfIngredient: String
+ deleteIngredient(int): boolean

#### *Explanations*

In this Ingredient class, compare to the same class in section 2.1, there are 1 new attributes and 3 changes with origin attributes: idOfIngredient which is int type; nameOfIngredient which is String

type; amountOfIngredient which is float type; and unitOfIngredient which is char type. There is a new methods: deleteIngredient function which use int type data and return with boolean type;

Constraints (optional)

N/A

### 3.2.6 RecipeIngredient

<b>RecipeIngredient</b>
+ addIngredientToRecipe(int,String):void

#### *Explanations*

In this RecipeIngredient class, compare to the same class in section 2.1, there are no attributes. There is only one method: addIngredientToRecipe function which use int and String type datas and return with void type.

Constraints (optional)

N/A

### 3.2.7 StorageIngredient

<b>StorageIngredient</b>
+ subtractAmount(int, float): boolean + addAmount(int, float): boolean + addIngredient(String, float, String):void

#### *Explanations*

In this StorageIngredient class, compare to the same class in section 2.1, there is no attribute. There are 3 change with origin methods: subtractAmount function which use int, float type data and return with boolean type; addAmount function which use int, float type data and return with boolean type and addIngredient, use string and float data type and no return value.

Constraints (optional)

N/A

## **4. Alternative detailed design (Optional)**

*N/A*

## **5. More considerations**

This diagram could be changed according to the situation, when reading this document, please contact us if you cannot understand well.
