1. Overview

1.1 Project description

“Brew Day!” is an application that allows home brewers to maintain an organized database of their beer recipes. The application allows users to create, store and modify recipes, and later on delete them, if the user wishes to do so. And users can write note after using a specific recipe to brew beer.

1.3 Design purpose

The architecture design document is to divide the system into several parts and let users work together in a more efficient way.

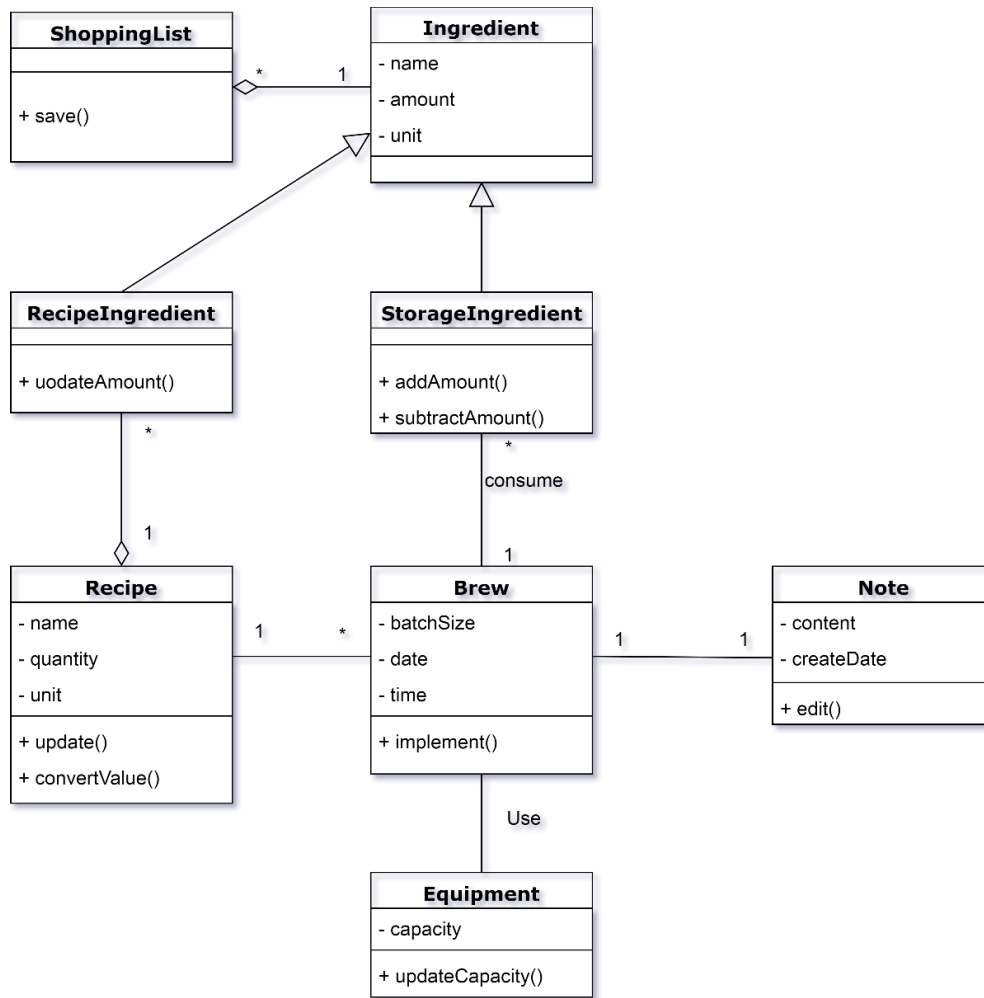

2. Overall description

2.1 Use case diagram and class diagram

Use case diagram.

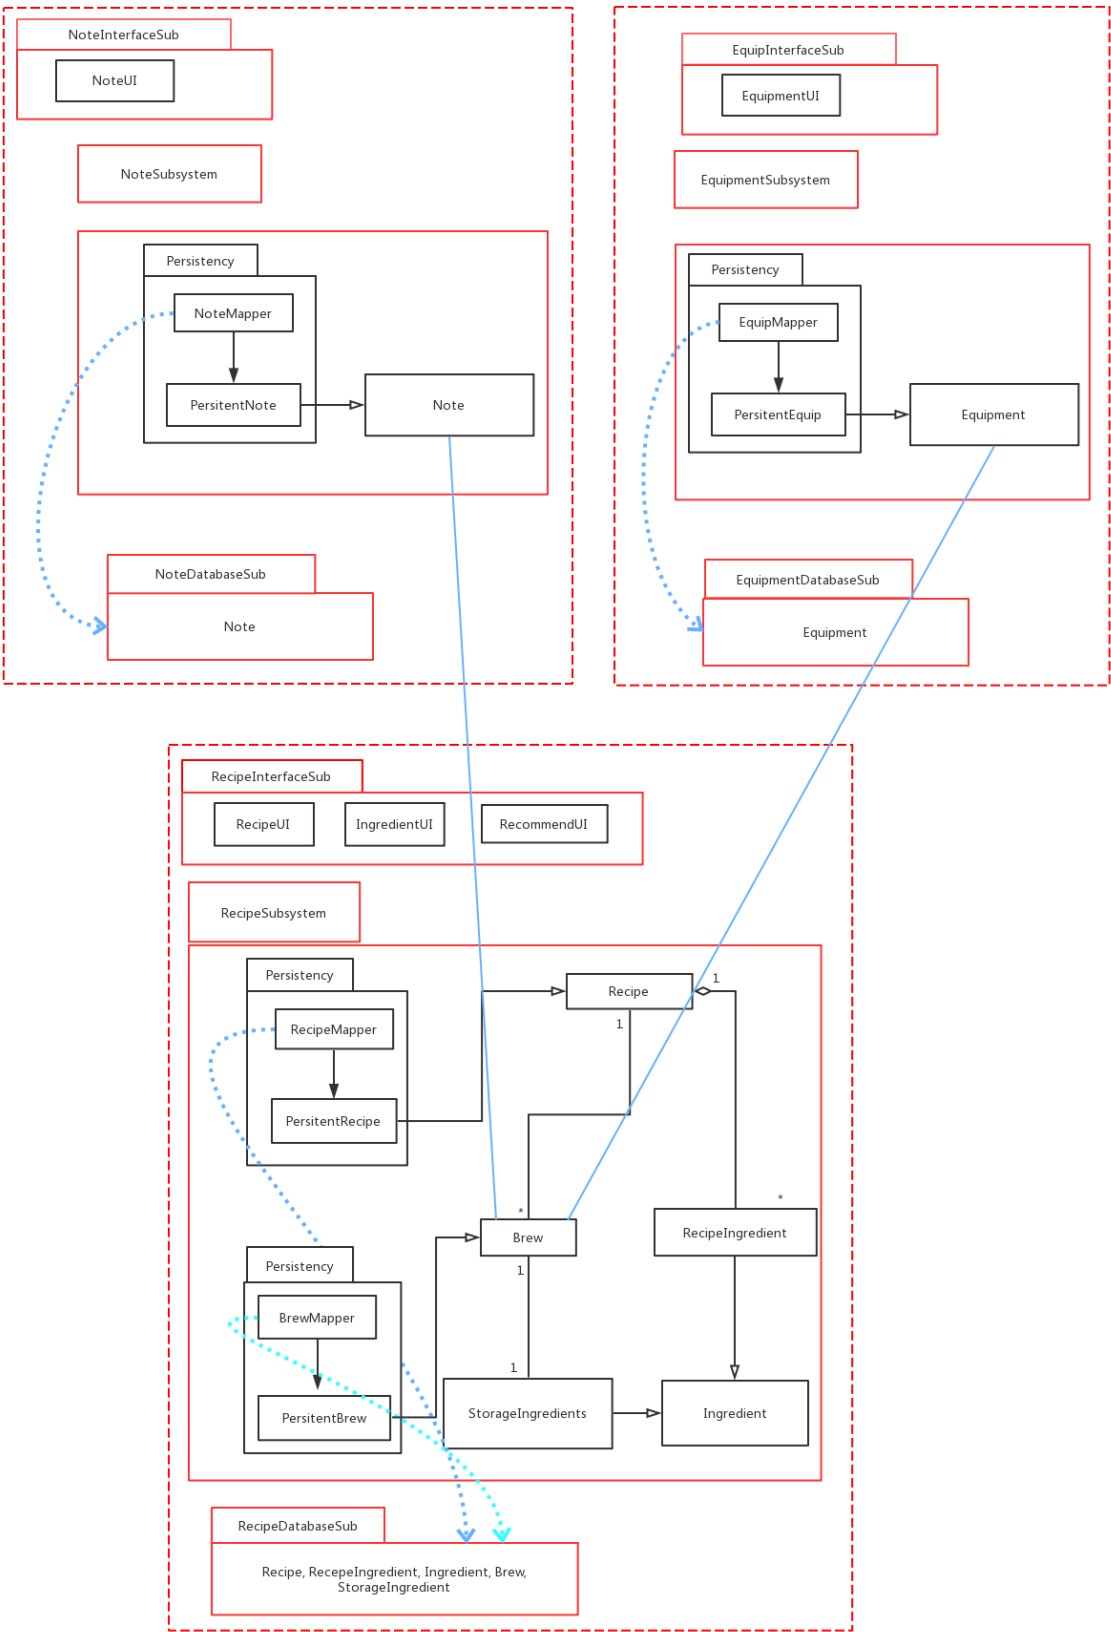

Class diagram.

2.2 Design model

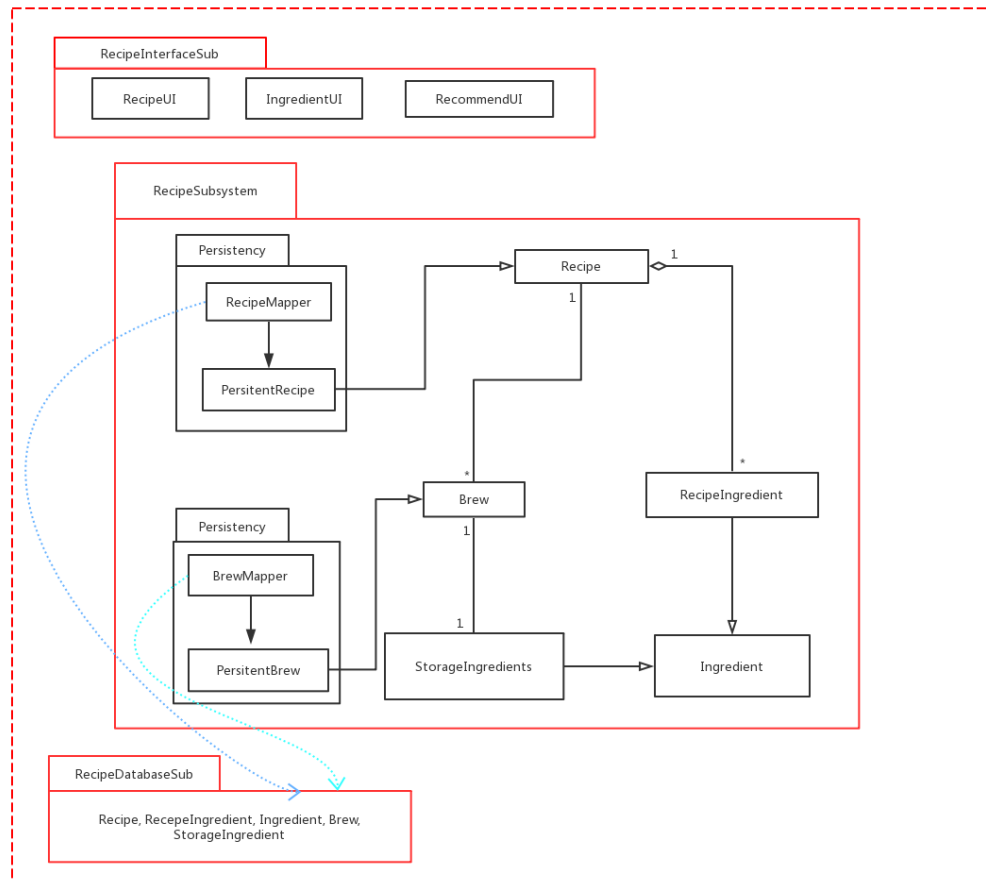

We built the architecture on MVC model. Because MVC can be developed simultaneously. And MVC enables logical grouping of related actions on a controller together. The views for a specific model are also grouped together, which has really high cohesion. It is easy to develop and modify in the future, because of the separation of responsibilities.

2.3 System architecture

3. System architecture

3.1 Recipe Subsystem

3.1.1 Description

In recipe subsystem, it contains recipes, ingredients and recommendations. The recipe mapper and brew mapper will stored as permanent data.

3.1.2 Database

Recipe			
<u>RecipeID</u>	Name	Quantity	Unit
1	Beer	100	L
2	type1	...	g
3	type2	...	g

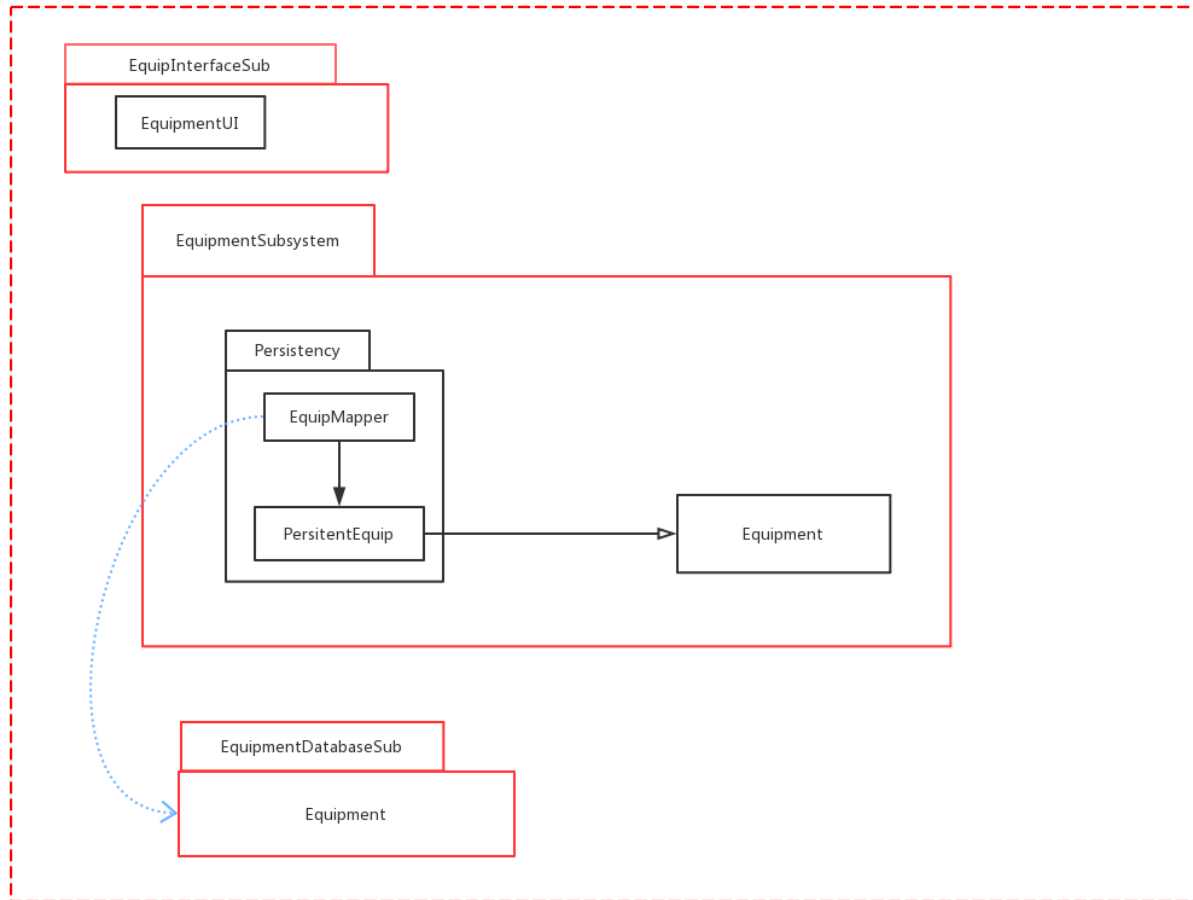

RecipeIngredient				
<u>RecipeIngredientID</u>	Name	Amount	Unit	<u>RecipeID</u>
1	Water	10	L	1
2	...			1
3	...			1

Ingredient			
<u>IngredientID</u>	Name	Amount	Unit
1	Water	10	L
2	Sugar	100	g
3	Yeast	100	g

Brew				
<u>BrewID</u>	<u>BatchSize</u>	Date	Time	<u>RecipeID</u>
1630013011	10L	20190301	21:00	1
1630013011	20L	20190306	08:00	2
1630000000	50L	20190401	05:00	3

StorageIngredient				
<u>StorageIngredientID</u>	Name	Amount	Unit	<u>BrewID</u>
1	Water	2	L	1
2	...	5	g	1
3	...	10	g	1

3.2 Equipment Subsystem

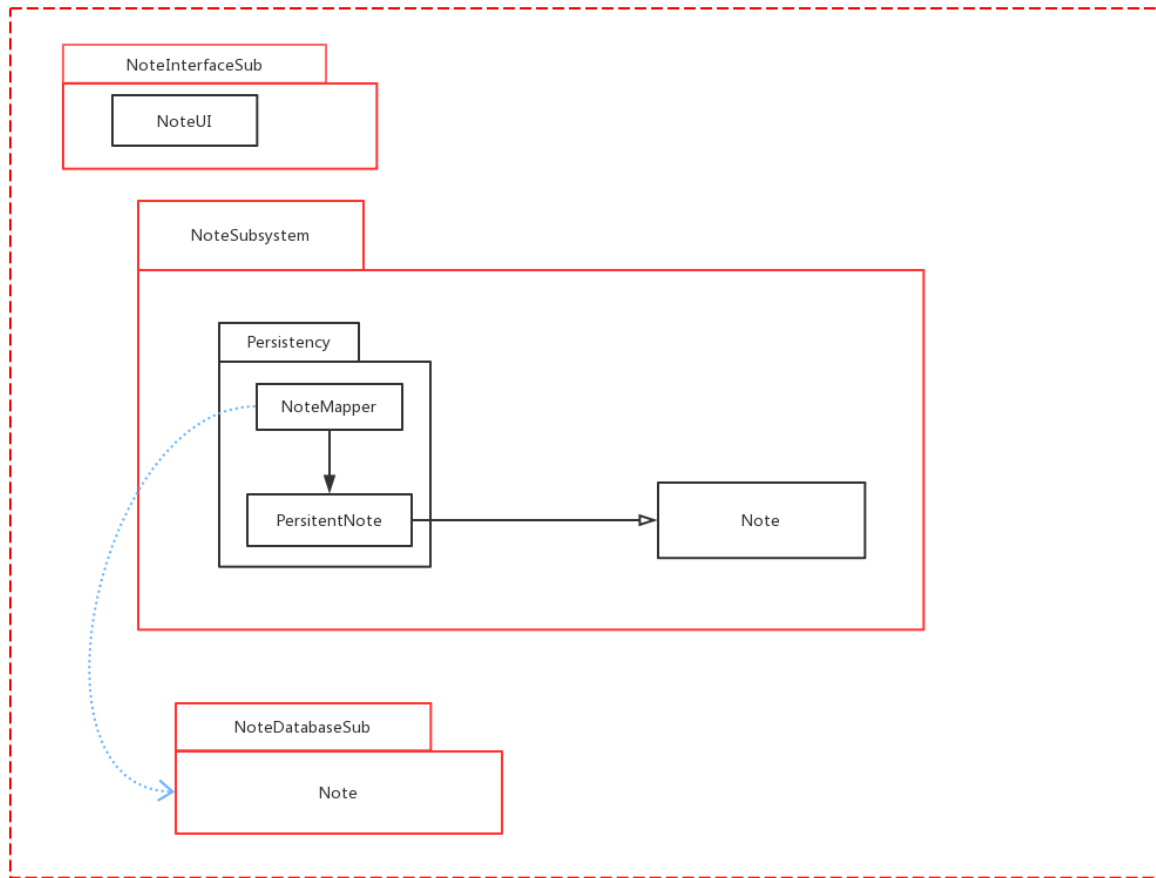

3.2.1 Description

In equipment subsystem, it is used to control the equipment. The equipment mapper will stored as permanent data.

3.2.2 Database

Equipment	
<u>EquipID</u>	Capacity
1	5L
2	10L
3	20L
4	50L

3.3 Note Subsystem

3.3.1 Description

In note subsystem, it is used to control the writing note part of the whole system. The note mapper will stored as permanent data.

3.3.2 Database

Note			
<u>NoteID</u>	Content	<u>createDate</u>	<u>BrewID</u>
1	Good...	20190301	1
2	Bad...	20190309	2
3	Not bad...	20190401	3

4. Assessment

4.1 Stability

This architecture that the system is based on is really stable. Because we design the system by MVC model. If some changes are made to certain components, there will not be influenced to other subsystems components.

In MVC model, controller can relate all the other parts together to have a high cohesion. And the coupling in controller, view and model in MVC model framework is low. Thus, the system is really stable.

4.2 Reusability

The components of the system can be used in other place without changes or with just a little change. For example, in the model component, all the data will connect to the database in the model. And MVC model allows access to the same controller with a variety of different styles of view, because multiple views can share a single model.

4.3 Scalability

It is easy for the system to extend the architecture. Just like reusability, we can add component all based on the database in the model. And we can design different views, the UI, for the system. All the developers can easily extend with the architecture.

5. Alternative design (optional)

6. More considerations

We will use java language for this system.

7. Appendix
